(54) Title: METHOD OF HEAT-SEALING ADHESIVE BANDAGE AND ADHESIVE BANDAGE MADE BY USING SAID METHOD

(57) Abstract

Object: to improve adhesive power to the skin without impairing excellent gas permeability and water vapor permeability when a laminate film comprising a film, a fiber fabric and an adhesive layer is sealed by heating at the same time in order to prevent an invasion of liquid from a side of the adhesive bandage. Means, in an adhesive bandage

comprising a base sheet made by laminating a film on a thermoplastic fiber fabric and an adhesive layer set on a surface of the thermoplastic fiber fabric of the base sheet, the adhesive bandage is pattern-sealed. The heat seal is preferably performed under the condition that the film does not melt but the thermoplastic fiber fabric melts, and only the periphery of the adhesive bandage may be pattern-sealed.

5 **METHOD OF HEAT-SEALING ADHESIVE BANDAGE AND ADHESIVE
BANDAGE MADE BY USING SAID METHOD**

Technical Field of the Invention

10 This invention relates to adhesive-coated sheet
materials, adhesive bandages comprising said adhesive-
coated sheet materials, methods for making said sheet
materials and methods for making said adhesive bandages.
15 More specifically, the adhesive-coated sheet materials
of the invention comprise fabric-film laminates which
have been heat sealed in a discontinuous pattern and
have had adhesive applied thereto. Even more
specifically, the mentioned heat sealing is limited to
20 regions of the sheet material adjacent its periphery.
Preferably, the film is water vapor permeable and the
fabric is porous so as to permit the relatively
unimpeded passage of air and water vapor therethrough.
Adhesive bandages according to the invention have
improved adhesion to skin.

25

Prior Art

Methods of making vent holes in adhesive bandages in
order to allow skin respiration when the adhesive
30 bandages are applied to the skin are well-known.
However, skin respiration is reduced in those portions
of the bandages which do not have vent holes.
Furthermore, such bandages permit an invasion of water
through the vent holes, making it difficult for bandage
35 users to conduct daily works such as kitchen work, a
bath, etc. while adhering adhesive bandage after it has

-2-

5 been contacted by water. Consequently in such cases,
users must peel off the adhesive bandage when starting
their daily work, and after the work is over a new
bandage is applied again. This is laborious and may
involve the disposal of still usable bandages. As a
10 measure against these problems, an adhesive bandage
comprising a base sheet made of a nonwoven fabric on
which a film having water vapor permeability and water
proofing property is laminated and an adhesive layer
with water vapor permeability has been proposed.

15 In such an adhesive bandage, water invasion through the
surface of the base sheet to a pad covering a wound may
be prevented, but water will soak into the pad through a
cut section of the nonwoven fiber fabric at the
20 periphery of the bandage. Consequently it is necessary
to prevent effectively the water soaking into the pad
from the periphery of the bandage. As a measure against
this problem, a method of sealing the periphery of the
bandage by heating has been proposed in Japanese Laid-
25 open Patent Hei 8-33673. However, even in bandages made
by using such method, there is a problem in that the
film may peel off the nonwoven fabric.

30 This invention uses an improved method of heat sealing
in order to reduce or eliminate the aforementioned
problems. As mentioned above, adhesive bandages in
accordance with the invention have improved adhesion to
skin.

-3-

5 Detailed Description of the Invention

10 This invention relates to a method of heat sealing an adhesive bandage comprising a base sheet made by laminating a film on a thermoplastic fiber fabric and an adhesive layer set on a surface of the thermoplastic fiber fabric of said base sheet, characterized by said adhesive bandage being pattern-sealed, and more particularly, to a method of heat seal performed under the condition that the film does not melt and preferably only the thermoplastic fiber fabric melts. In the present invention, it is preferred that only the periphery of the adhesive bandage is pattern-sealed. Further it is preferred that the adhesive bandage is a dressing for medical treatment or an adhesive bandage having a pad. More particularly, the present invention relates to a method of heat-sealing an adhesive bandage which comprises laminating a base fabric made of a thermoplastic fiber having gas permeability on a film having water vapor permeability and gas permeability to make a base sheet, and coating an adhesive layer on the surface of the thermoplastic fiber fabric of the base sheet, characterized in that the pattern seal provides said bandage with water proofing property, and it is preferred that the heat seal is performed under the condition that the film does not melt but the thermoplastic fiber fabric melts, in particular, only the periphery of the adhesive bandage is sealed. Further it is preferable that the adhesive bandage has a pad. The present invention further relates to an adhesive bandage which being made by means of the methods described above, particularly an adhesive

15
20
25
30
35

-4-

5 bandage having a pad which is made by means of the methods described above.

Adhesive bandage refers to a strip of a fabric or the other materials coated uniformly with a pressure-sensitive adhesive on one side of the surface, but an
10 adhesive bandage in the present invention also includes an adhesive bandage having a wound-contacting pad and, further, a dressing for medical treatment to bind up a wound in wide range.

15 The thermoplastic fiber fabric used in the present invention includes woven fabrics and nonwoven fabrics made of thermoplastic elastomers. The reason the fiber fabric must be made of a thermoplastic elastomer is that
20 the fiber fabric must melt and be pressed by pressure and heat to give the bandage a water-proofing property when heat-sealed. Also such fiber fabric preferably has gas permeability and elasticity.

25 The thermoplastic elastomer can be, for example, polystyrene type elastomers such as styrene-isoprene-styrene type block copolymer and hydrogenated block copolymers made by hydrogenating said block copolymer, polyurethanes, polyesters, polyolefines such as
30 polyethylene, and mixtures thereof; they are, however, not critical. The fabric of the present invention can be either a woven fabric or a nonwoven fabric, but the nonwoven fabric is preferred because the directional dependency of physical properties such as elasticity is
35 low.

-5-

5 When using a nonwoven fabric as a fiber fabric, the percentage expansion of the nonwoven fabric is preferably 100% or more, and the recovery at 50% expansion is 70% or more.

10 The weight of the nonwoven fabric of this invention has to be properly selected depending on properties of the nonwoven fabric itself, the laminating film and the adhesive, but cannot particularly be limited. However, the weight is preferably 20 to 200 g/M², more preferably
15 30 to 100 g/M². A thickness of the nonwoven fabric may be such a thickness that a sufficient stiffness is imparted to the adhesive bandage when laminating a film on the nonwoven fabric. The nonwoven fabric of this invention can be thinner than that of conventional
20 adhesive bandages. The thickness of the nonwoven fabric is about 20 to 1,000 μ m, preferably 50 to 500 μ m. It is preferable to make the film thin so as to ensure high gas permeability and water vapor permeability.

25 The film to laminate the fiber fabric in this invention is used to impart water proofing property to the adhesive bandage without much decrease in gas permeability and water vapor permeability of the fiber fabric as well as to ensure a suitable balance of
30 properties when an adhesive bandage is made. The material of the film is required to have a water proofing property and to have sufficient water vapor permeability even after being laminated to a fiber fabric. As such films, known films made of
35 polyurethanes, polyvinyl chloride, polyvinylidene chloride, polyolefines such as polyethylene and

-6-

5 polypropylene, polyesters, polyamides and so forth can be used. Polyurethane films and polyester films in particular are preferred among them.

10 As polyester elastomers, for example, polyester elastomer "Hytrel" (Trade Mark of E. I. DU PONT DE NEMOUR AND COMPANY), "Fleclone" (Trade Mark of Nichigo Film Kabushiki Kaisha) and so forth are preferred. Since the laminating film must have a sufficient water proofing property, a film obtained by extrusion molding, 15 blow-molding or the like is desirous. A drawn film may also be used. The laminating film can be also a multilayered film formed by laminating films made of different materials.

20 If the material of the laminating film has a low water vapor permeability, the film has to be thin in order to have the desirable water vapor permeability. If the material of the laminating film has high water vapor permeability, it can be thick, but has to have suitable 25 stiffness when laminated on the fiber fabric. From this standpoint, the thickness of said film is preferably 50 μm or less, more preferably 2 to 30 μm , and even more preferably, 5 to 15 μm . Since an adjustment of the balance of properties becomes easy by laminating the 30 film on the fiber fabric, it is possible to use a variety of fiber fabrics, especially less stiff and thin ones, and to improve strength and chemical resistance. The method of laminating the film on the fiber fabric is not particularly limited, but the laminating can be 35 carried out by bonding with a bonding agent, heat-fusion or the like. The laminating may be conducted on the

-7-

5 fiber fabric either before or after coating the adhesive thereon.

10 The adhesive used in the adhesive bandage of the present invention is not particularly limited as long as the skin is little irritated and pressure-sensitive adhesion to the skin is provided. Examples of the adhesive include rubbery adhesives, acrylic adhesives, polyurethane adhesives, silicone adhesives and A-B-A type block copolymer type adhesives such as styrene-isoprene-styrene block copolymer type adhesives, etc. 15 The whole adhering surface of the fiber fabric can be coated with such solid adhesives shown above. However, in order to prevent a decrease in water vapor permeability, it is preferred to coat the fiber fabric with a porous adhesive or to pattern-coat with such an adhesive instead of coating the whole surface. 20

The thickness of the adhesive layer is 25 to 150 μm , preferably 30 to 60 μm .

25 The adhesive layer can be either a solid one or a porous one, but a porous layer is preferred in order to ensure high gas permeability of the adhesive layer. As a method of making the adhesive porous, there is, for example, a method in which a highly water-absorbable polymer is used as a blowing agent, which fully absorbs water, the resulting polymer is dispersed into an adhesive solution, the dispersion is coated, and a moisture is then evaporated to make the adhesive porous. 30 This method is, however, not critical. 35

-8-

5 Regarding the pattern coat, the adhesive can be coated
on the backing sheet by, for example, screen coating or
gravure coating. However, these coating methods are not
critical.

10 As a method of coating the adhesive on the backing
sheet, there can be used various known methods such as a
method in which the fiber fabric is directly coated with
the adhesive, a method in which a release paper is
coated with the adhesive and then the adhesive is
15 transferred onto the fiber fabric, and the like.

Methods of heat sealing can be that of pressing a
subject sheet with a flat face maintaining a
predetermined temperature, that of pressing a sheet
20 with, e.g., a rotary press, etc. The method is,
however, not critical.

The pattern seal refers to a heat seal method that does
not seal the whole surface of the sealing area but
25 leaves unsealed surface portions in the sealing area.
The pattern seal of this invention means that sealed
surface and unsealed surface makes a pattern such as
sea-island distribution (distributing unsealed area over
sealed area such as islands in the sea). In the present
30 invention, the sealed portion is the sea and unsealed
portion is an island. The ratio of the sea area to the
island area is preferably about 10:90 to 50:50. The
sealed portion must continue without break, thereby the
pad portion is isolated by the sealed area from the
35 surroundings outside. This isolation prevents an
invasion of water etc. from the outside. Examples of

-9-

5 such pattern seals are shown in (a) to (e) in Figure 1.
However the patterns are not limited to those
illustrated in Figure 1 as long as the above-mentioned
conditions are satisfied. The pattern seal provides the
10 sealing area with a higher gas permeability and water
vapor permeability than the flat seal, that is referred
to herein as "flat seal", since the unsealed surface has
higher gas permeability and water vapor permeability
than the sealed surface. Further, the pattern seal
gives an answer to the problem of the flat seal that the
15 periphery of the adhesive bandage tends to peel of the
skin caused by a lowering of adhesive power of the
sealed section because the adhesive layer is made thin
by pressure and heat applied during heat seal process.

20 The heat sealing step of the present invention is
preferably performed under the condition that the film
does not melt but the thermoplastic fiber fabric melts
so as to prevent an invasion of water etc. from a cut
section of the fiber fabric while maintaining the water
25 proofing property of the film surface. Therefore in
order to satisfy such a condition, the melting
temperature of the film material is preferably higher
than that of the fiber fabric material. Further it is
necessary to set the heat seal conditions such as
30 sealing temperature, time, etc. so that the film does
not melt but only the fiber fabric melts. For example,
in the case of the combination of polyurethane film and
hydrogenated styrene-isoprene-styrene block copolymer
fiber fabric, the melting temperature of the
35 polyurethane is about 160 to 200°C, and that of the
hydrogenated styrene-isoprene-styrene copolymer is about

-10-

5 120°C. And in the case of the combination of polyester
film and above fiber fabric, the melting temperature of
polyester is about 170 to 210°C. Consequently both cases
satisfy the condition that the melting temperature of
10 the film is higher than that of the fiber fabric. Such
a combination makes it possible that only the fiber
fabric melts when heat seal is performed at about the
melting temperature of the film.

15 The heat seal of the present invention can be performed
either on the whole surface of the bandage or on the
peripheral portion only. When the whole surface of the
bandage is sealed by heating, the gas permeability and
water vapor permeability thereof will become lower than
20 if only the periphery thereof is sealed, since the both
gas permeability and water vapor permeability of the
heat seal area are lower than those of unsealed area.
However, the defect can be prevented to some extent by,
e.g., selecting a proper sealing pattern and so forth,
and in particular there is an advantage that the heat
25 seal can be performed at the same time in a process for
laminating a film to a fiber fabric. Figure 2
illustrates when the bandage of this invention is a
dressing for medical treatment. In Figure 2, the whole
surface of the adhesive shown by 4 is pattern-sealed.
30 Figure 3 shows a side view thereof. Figure 4
illustrates a side view of a dressing having a pad in
the center thereof.

35 When only the periphery of the bandage is heat-sealed,
there is no concern about a lowering of gas permeability
or water vapor permeability. In the case of a small

-11-

5 bandage such as an adhesive bandage having a pad, there
is a problem regarding difficulty of the positioning of
heat seal since the sealing area must be made in a
constant width all around. This problem can be solved
10 by performing heat sealing and cutting of the bandage at
the same time. Figure 5 shows a front view of an
adhesive bandage having a pad of the present invention
when only the periphery of the bandage is heat-sealed.
In the figure, the hatched portion is heat-sealed.
Figure 6 shows a sectional view thereof.

15 The adhesive bandage of the present invention may be
formed by any method. Examples of such methods include
a method in which a long film having a suitable width is
wound up to form a sheet adhesive bandage, a method in
20 which a film strip of suitable size is provided, a
water-absorbable pad is held on the central portion of
the strip, and the adhesive surface is further covered
with a release paper to form an individual package of an
adhesive bandage, a method in which a strip of suitable
25 size is provided, and its adhesive surface is covered
with a release paper without placing a pad to form an
individual pack of an adhesive bandage, and so forth.

30 Fabrics used in the invention have a moisture vapor
transmission rate (MVTR) of at least 1000 g/m²/day,
preferably at least 2500 g/m²/day, even more preferably,
at least about 5000 g/m²/day.

35 Film used in the invention have an MVTR of at least
about 500 g/m²/day, preferably at least about 1500

-12-

5 g/m²/day, even more preferably at least about 2500 g/m²/day.

The fabric/film laminate of the invention has an MVTR of at least about 500 g/m²/day, preferably at least about 1000 g/m²/day, even more preferably at least about 1500 g/m²/day.

The adhesive-coated laminate of the invention has an MVTR of at least about 500/m²/day, preferably at least about 750 g/m²/day, even more preferably at least about 1000 g/m²/day.

MVTR values are determined in accordance with Test Method JIS Z 0208 corresponding to ASTM Test Procedure F 1249-90.

This invention will be explained more specifically by referring to the following Examples.

25 Examples

Example 1 and Comparative Example 1:

A 10 μ m-thick polyurethane film was laminated by heat fusion to one surface of a nonwoven fabric which is made by melt-blown spinning of a hydrogenated styrene-isoprene-styrene block copolymer with a styrene content of 27% by weight. The weight of the nonwoven fabric was 50 g/m². Subsequently, an acrylic adhesive was coated on the opposite surface of the nonwoven fabric such that

-13-

5 the thickness of the adhesive layer was 50 μm , and the
coated adhesive was dried to thereby obtain an adhesive
film for use in making an adhesive bandage. In order to
make an adhesive bandage shown in Figure 5 from this
10 adhesive film, the periphery in 2 mm width of the
bandage was heat-sealed, and then the adhesive bandage
was made by cutting out in the shape of Figure 5.

In Example 1, the pattern illustrated in Figure 1 (a)
was applied for the heat seal. The length of the
15 diagonal line of the unit square of this pattern was
1 mm. In Comparative Example 1, the bandage was flat-
sealed on 2 mm wide peripheral section. A wear test was
carried out by using said adhesive bandages as testing
samples. The heat seal was performed by a steel roller
20 with a diameter of 120.3 mm having a pattern of Figure 1
(a) on the surface of the roller under the condition of
180°C in roll surface temperature and 22.2m/minute in
feed velocity.

25 The wear test was carried out as follows: Test samples
of the adhesive bandage were adhered on a finger and an
arm of subjects. The subjects engaged in their usual
activities, An evaluator evaluated the peeling situation
of the adhesive bandage according to the criteria below
30 after 6 hrs and 24 hrs for the finger, and for 24 hrs
for the arm. The result was estimated as an average
value of the evaluations of all the subjects

-14-

- 5 (1) Wear Test (Finger)
- 5 Perfect adhesion
- 4 Heat seal is up slightly
- 3 One side of a pad off
- 2 Both sides of a pad of f
- 10 1 Both sides of a pad of and film becomes a wrinkle
- 0 Bandage off
- (2) Wear Test (Arm)
- 7 All edges adhering firmly
- 15 6 One or two edges up slightly of heat seal
- 5 Heat seal 1/4 off
- 4 Heat seal 1/4 to 1/2 off
- 3 Heat seal 1/2 to 3/4 off
- 2 Heat seal all off
- 20 1 Heat seal in addition to flap off
- 0 Bandage off

The results were shown in Table 1

25

Table 1

Example No.		Ex. 1	C. Ex. 1
Test items	Test time (hour)	Pattern seal	Flat seal
Wear test (finger)	6	3.87	3.43
	24	1.67	1.63
Wear test (arm)	24	6.29	5.75

-15-

5 It was shown that the bandage of Example 1 had a better adhesive property than that of Comparative Example 1 whose whole seal area was sealed, that is, a flat seal.

10 Example 2, Comparative Example 2

15 In order to compare the adhesive power of the pattern seal with that of the flat seal, an adhesion test to glass was carried out using the adhesive bandage of Example 1. In Example 2, the pattern seal shown in Figure 1(a) was used. In Comparative Example 2, a flat seal, the heat seal conditions were the same as Example 1. The testing method of adhesion to glass is as follows:

20 Adhesion to glass:

A laminate comprising a film, a nonwoven fabric and an adhesive was cut into a width of 25.4 mm (1 inch) and bonded to a glass plate washed with acetone. A weight load was exerted on the test sample on the glass by one reciprocation with a rubber-coated roller having a weight of 4.5 kg. The pulling rate was set at 300 mm/minute, and the test sample was pulled at an angle of 180° against the adhesive surface. The load weight was recorded when the test pieces were peeled from the glass surface. Test results are shown in Table 2.

-16-

5

TABLE 2

Example No.	Ex. 2	C. Ex. 2
Seal method	Pattern seal	Flat seal
Measurement (g/25 mm)	240	172
	252	183
	252	183
	274	194
	291	229
Average	262	192

10 As shown in Table 2, the adhesive power of the pattern seal is about 36% higher than that of the flat seal.

Example 3

15 The pattern seal procedure of Example 1 was repeated except that 159m thickness polyester film (trade name: Fleclone, Nichigo Film Kabushiki Kaisha) was used as the film for the base sheet, and thereby an adhesive bandage was made. This bandage also showed similar practical properties as that of Example 1 and was confirmed to have excellent water resistance and air permeability.

20

Effects of the Invention

25 The adhesive bandage of the present invention shows, by the pattern seal of either the whole surface or the peripheral surface of the bandage, an improved adhesive property to skin without impairing gas permeability and water vapor permeability compared to flat seal bandages

-17-

5 wherein the whole seal area is sealed by heating, and
may effectively prevent soaking of liquid such as water
into an absorbent pad and a wound.

-18-

5 WHAT IS CLAIMED IS:

1. A method for making an adhesive-coated sheet material, said method comprising the steps of:

10 A. providing a film of polymeric material;

B. providing a thermoplastic fiber fabric;

15 C. laminating said film to said fabric to form a laminated sheet material having a fabric surface and a film surface;

D. applying a layer of adhesive to said fabric surface of said laminated sheet material; and

20 E. heat-sealing at least a portion of said laminated sheet material in a discontinuous pattern.

25 2. A method according to Claim 1 wherein step D is performed before step E.

3. A method according to Claim 1 wherein step E is performed before step D.

30 4. A method according to Claim 1 wherein the heat-sealing is performed under conditions such that at least portions of the thermoplastic fiber fabric melt but the film does not melt.

-19-

5 5. A method according to Claim 1 wherein only the periphery of the sheet material is heat-sealed in said pattern.

10 6. A method for making an adhesive bandage, said method comprising the steps of:

 A. providing a film of polymeric material;

15 B. providing a thermoplastic fiber fabric

 C. laminating said film to said fabric to form a laminated sheet material having a fabric surface and a film surface;

20 D. applying a layer of adhesive to said fabric surface of said laminated sheet material;

 E. heat-sealing at least a portion of said laminated sheet material in a discontinuous pattern; and

25 F. securing a wound-contacting pad to the adhesive coating of said laminated sheet material.

30 7. A method according to Claim 6 wherein step D is performed before step E.

 8. A method according to Claim 6 wherein step E is performed before step D.

35 9. A method according to Claim 6 wherein the heat-sealing is performed under conditions such that at least

-20-

5 portions of the thermoplastic fiber fabric melt but the film does not melt.

10. A method according to Claim 6 wherein only the periphery of the sheet material is heat-sealed in said
10 pattern.

11. An adhesive-coated sheet material comprising:

- 15 a. a film of polymeric material;
- b. a thermoplastic fiber fabric, and
- c. an adhesive,
20 said film being laminated to said thermoplastic fiber fabric; said laminate having a fabric surface and a film surface; said adhesive being applied to said fabric surface of said laminate; and at least a
25 portion of said laminate being heat-sealed in a discontinuous pattern.

12. An adhesive bandage comprising:

- 30 a. a film of polymeric material;
- b. a thermoplastic fiber fabric;
- c. an adhesive;
- 35 d. a wound-contacting pad;

-21-

5 said film being laminated to said
thermoplastic fiber fabric; said laminate
having a fabric surface and a film surface;
said adhesive being applied to said fabric
10 surface of said laminate; at least a portion
of said laminate being heat-sealed in a
discontinuous pattern; said pad being secured
to said laminate by said adhesive.

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 673 657 A (JOHNSON & JOHNSON CONSUMER) 27 September 1995 see abstract see page 2, line 1 - line 5 see page 2, line 30 - line 41 see page 3, line 7 - line 23 see page 3, line 33 - line 36; claims; example 3 ---	1-12
A	US 3 908 650 A (DUNSHEE WAYNE KEITH ET AL) 30 September 1975 ---	
A	US 4 304 333 A (KOZLOW SR WILLIAM) 8 December 1981 ---	
A	US 4 545 372 A (LAURITZEN NELS J) 8 October 1985 --- -/-	

☒ Further documents are listed in the continuation of box C.☒ Patent family members are listed in annex.

* Special categories of cited documents:

- * "A" document defining the general state of the art which is not considered to be of particular relevance
- * "E" earlier document but published on or after the international filing date
- * "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- * "O" document referring to an oral disclosure, use, exhibition or other means
- * "P" document published prior to the international filing date but later than the priority date claimed

* "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

* "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

* "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

* "&" document member of the same patent family

Date of the actual completion of the international search

9 September 1997

Date of mailing of the international search report

25.09.97

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
